

Principle of operation

Ice thermal storage

Principle of operation

The TSU-C/D is an external melt system that produces and builds **ice (1)** around a **coil (2)** submerged in **water (3)**. A **refrigerant or cold glycol (4)** circulates through this, while ice accumulates on the outside. The ice is melted by circulating **warm water (5)** from the load over the coil, which **cools the water (6)**. Low pressure **air (7)** from an **air pump (8)** is distributed below the coil for water agitation.

Want to use the TSU-C/D ice storage system? Contact your local [BAC representative](#) for more information.
