

Closed circuit cooling towers

Options and accessories

Sound attenuation

VFL closed circuit cooling towers use **quiet centrifugal fans**, but to **reduce noise even further**, you can extend your VFL cooling tower with sound attenuators at the air intake and discharge points.

For residential areas:

Sound attenuation ([HS type](#))

- Discharge attenuator with vertical baffles
- Intake attenuator with straight baffles

For rural areas:

Heavy sound attenuation ([HD type](#))

- Discharge attenuator with vertical baffles
- Double intake attenuator with straight baffles

Your [local BAC representative](#) can explain any of the above sound attenuator options in more detail and provide you with [sound pressure and sound power data](#).
